How to Use Exception and Mobile Themes

By SBND Technologies

Support.ini File

The *support.ini* file located in a theme directory (*root/themes/your_theme*) shows the lowest version of a device and a browser that is supported by the system.

The entries in the *support.ini* file have the following format:

- ;device=min version
- ;browser=min version

You can use an exception theme when the website is opened with an earlier version of a browser/device. For example, if you remove the comment character (;) in front of *firefox=5*, when the website is opened with Mozilla Firefox version earlier than 5, it will use an exception theme.

```
1. ;android=0
2. firefox=5
3. ;msie=7
4. ;opera=11
5. ;chrome=14
6. ;safari=6
```

Adding an Exception Theme

You can download the example exception theme and put its content in the *root/themes/your_theme/exception* directory.

Using a Mobile Exception Theme

If you remove the comment character in front of *android=0*, when the website is opened with any Android version it will use the mobile theme located in the *root/themes/your_theme/exception/mobile* directory.

Below is the full list of mobile devices that the system recognizes:

```
1. "android"      => "android.*mobile",
2. "androidtablet" => "android(?!.*mobile)",
3. "blackberry"   => "blackberry",
4. "blackberrytablet" => "rim tablet os",
5. "iphone"       => "(iphone|ipod)",
6. "ipad"         => "(ipad)",
7. "palm"         => "(avantgo|blazer|elaine|hiptop|palm|plucker|xiino)",
8. "windows"      => "windows ce; (iemobile|ppc|smartphone)",
9. "windowsphone" => "windows phone os",
10. "generic"     => "(kindle|mobile|mmp|midp|pocket|psp|symbian|smartphone|treo|up
11. .browser|up.link|vodafone|wap|opera mini)"
```
